

# Start Up

**Introduction to Computer Graphics**

**Yu-Ting Wu**

# Library

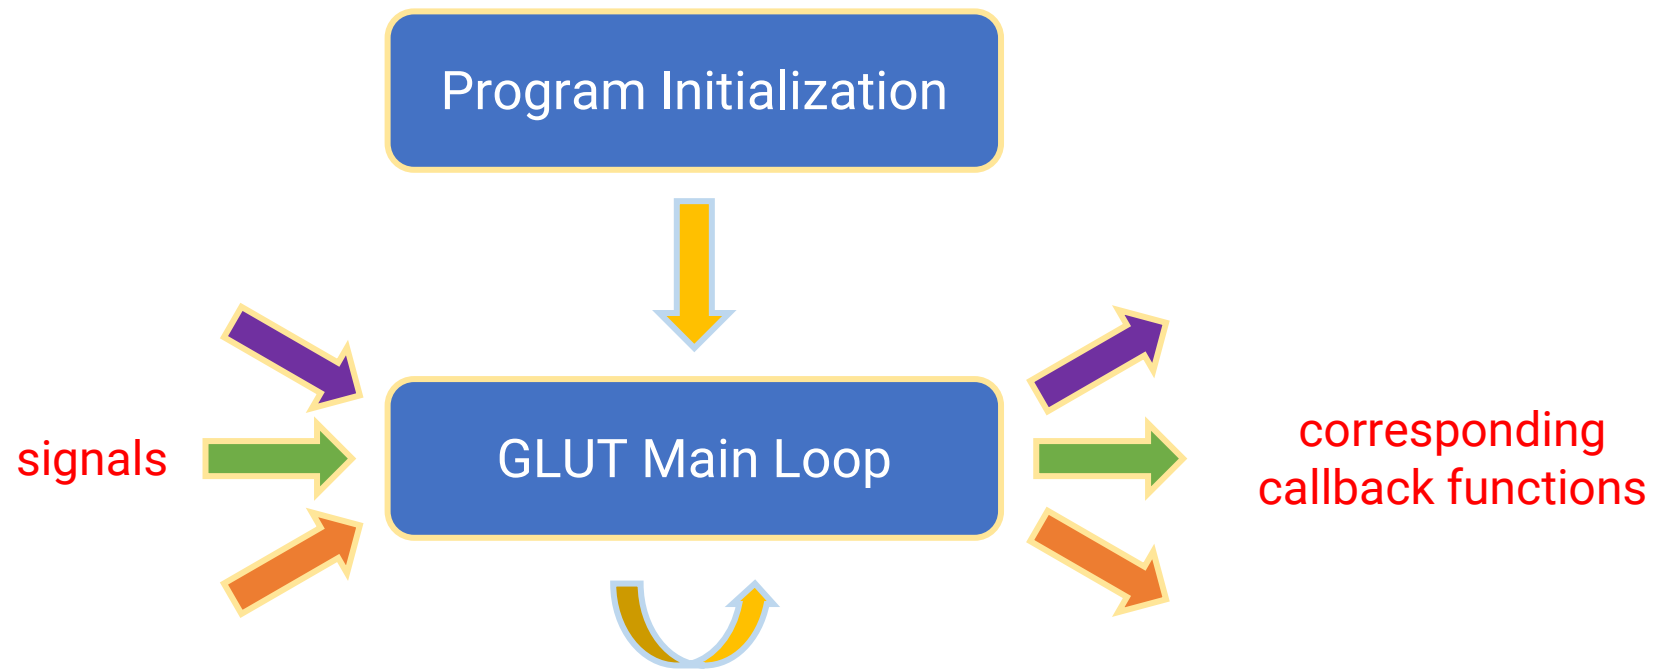

# Library

- **GLUT: OpenGL Utility Toolkit ([link](#))**
  - Window system independent
  - Implement a simple window application programming interface (API) for OpenGL
  - Designed for constructing small to medium-sized OpenGL programs
    - For large applications, it is suggested to use a native window system toolkit such as Qt for more sophisticated UI
- **FreeGLUT: Free OpenGL Utility Toolkit ([link](#))**
  - GLUT has gone into stagnation and has some issues with licenses
  - FreeGLUT is intended to be a full replacement for GLUT

# Program

# Program Structure Overview

- OpenGL programs are event-driven

# The First Program

```
// OpenGL and FreeGlut headers.
```

```
#include <freeglut.h>
```

```
int main(int argc, char** argv)
```

```
{
```

```
    // Setting window properties.
```

```
    glutInit(&argc, argv);
```

```
    glutInitDisplayMode(GLUT_DOUBLE | GLUT_RGBA | GLUT_DEPTH);
```

```
    glutInitWindowSize(640, 360);
```

```
    glutInitWindowPosition(100, 100);
```

```
    glutCreateWindow("OpenGL Renderer");
```

create the window  
and set window  
properties

```
    // Initialization.
```

```
    SetupRenderState();
```

do initialization  
jobs

```
    // Register callback functions.
```

```
    glutDisplayFunc(RenderSceneCB);
```

```
    glutIdleFunc(RenderSceneCB);
```

```
    glutReshapeFunc(ReshapeCB);
```

```
    glutSpecialFunc(ProcessSpecialKeysCB);
```

```
    glutKeyboardFunc(ProcessKeysCB);
```

register callback  
functions

```
    // Start rendering loop.
```

```
    glutMainLoop();
```

start the  
main loop

```
    return 0;
```

```
}
```

# Create a OpenGL (GLUT) Window

- *void **glutInit**(int \*argc, char \*\*argv);*

- Initialize the GLUT library

```
glutInit(&argc, argv);
```

- *int **glutCreateWindow**(char \*name);*

- Create a top-level window

```
glutCreateWindow("OpenGL Renderer");
```

# Setting Window Properties

- *void **glutInitWindowSize**(int width, int height);*

- Set the initial window size

- *void **glutInitWindowPosition**(int x, int y);*

- Set the initial window position

```
glutInitWindowSize(640, 360);  
glutInitWindowPosition(100, 100);
```

- *void **glutInitDisplayMode**(unsigned int mode);*

- Set the initial display mode

- <https://www.opengl.org/resources/libraries/glut/spec3/node12.html>

```
glutInitDisplayMode(GLUT_DOUBLE | GLUT_RGBA | GLUT_DEPTH);
```

# Setting Callback Functions

- Register the callback functions when receiving events
- Commonly used
  - *glutDisplayFunc*
  - *glutIdleFunc*
  - *glutReshapeFunc*
  - *glutKeyboardFunc* / *glutSpecialFunc*
  - *glutMouseFunc*
  - *glutMenuStatusFunc*
- Each callback function has its own input format
- Please refer to the following page for all possible callback functions
  - <https://www.opengl.org/resources/libraries/glut/spec3/node45.html>

# Setting Callback Functions (cont.)

```
void RenderSceneCB()
{
    glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT);
    // Render something here.
    // TODO.
    glutSwapBuffers();
}
```

clear the canvas (color buffer & depth buffer)

swap the front (for drawing) and back (for displaying) buffer

```
void ProcessKeysCB(unsigned char key, int x, int y)
{
    // Handle other keyboard inputs those are not defined as special keys.
    if (key == 27) { ESC
        // Release memory allocation if needed.
        exit(0);
    }
}
```

# Double Buffers

- Prevent artifacts due to potentially seeing parts of an incomplete frame (that is currently drawn)
  - Set the display mode to **GLUT\_DOUBLE** in the **glutInitDisplayMode** function
  - Call **glutSwapBuffers** after rendering finished

# Initialization

- *void **glClearColor**(GLfloat red, GLfloat green, GLfloat blue, GLfloat alpha);*
  - Set the color to clear the color buffer

```
void SetupRenderState()
{
    float clearColor[4] = {0.44f, 0.57f, 0.75f, 1.00f};
    glClearColor(
        (GLclampf)(clearColor[0]),
        (GLclampf)(clearColor[1]),
        (GLclampf)(clearColor[2]),
        (GLclampf)(clearColor[3])
    );
}
```

# Start the Main Rendering Loop

- *void **glutMainLoop**(void);*
  - Enter the GLUT event processing loop
  - OpenGL programs are event-driven

**Any Questions?**
