## Introduction to Computer Graphics

Yu-Ting Wu

(with some slides borrowed from Prof. Yung-Yu Chuang)

1

## The Rendering Equation

- Proposed by Kajiya [1986]

$$L(x, \omega_o) = \underbrace{L_e(x, \omega_o)}_{\text{emitted radiance}} + \underbrace{\int_{\Omega} \underbrace{L_i(x, \omega_i)}_{\text{incident radiance}} \underbrace{f_r(x, \omega_o \leftarrow \omega_i)}_{\text{bidirectional reflectance distribution function (BRDF)}} \underbrace{(N(x) \cdot \omega_i)}_{\text{geometry term}} d\omega_i}_{\text{reflected radiance}}$$

Integral of all directions

2

## Formal Material Representation

- In **Physically-based Rendering (PBR)**, the characteristic of a material is usually defined by **Bidirectional Reflectance Distribution Function (BRDF)**

$$f_r(x, \omega_o \leftarrow \omega_i)$$

- Describe how much light (**ratio**) coming from  $\omega_i$  will reflect toward  $\omega_o$  at point  $x$

A good representation should have

- Accuracy
- Expressiveness
- Speed

3

## Reflection Categories

4

## Classification of BRDF

- **Phenomenological models**
  - Qualitative approach
  - Models with intuitive parameters
  - Examples are Phong and Blinn-Phong lighting models
- **Geometric optics**
  - Microfacet models
- **Measured data**
  - Usually described in tabular form or coefficients of a set of basis functions

5

5

## Microfacet Model

6

6

## Microfacet Model

- Rough surfaces can be modeled as a collection of small **microfacets**
- The **aggregate behavior** of the small microfacets determines the scattering
- Two components for deriving a closed-form BRDF expression
  - The distribution of microfacets
  - How light scatters from the individual microfacet

7

7

## Microfacet Model (cont.)

Most microfacet models assume that all microfacets make up **symmetric V-shaped** grooves so that only neighboring microfacet needs to be considered

8

8

## Microfacet Model (cont.)

- Important geometric effects to consider

- Particular models consider these effects with varying degrees of accuracy

9

## Torrance-Sparrow Model

- One of the first microfacet model
- Designed to model **metallic** surfaces
- Assumption: a surface is composed of a collection of **perfectly smooth mirrored** microfacets with **distribution  $D(\omega_h)$**

10

## Torrance-Sparrow Model (cont.)

- Described by
  - Microfacet distribution  $D$
  - Geometric attenuation  $G$
  - Fresnel reflection  $F$

$$f_r(\omega_o \leftarrow \omega_i) = \frac{D(\omega_h)G(\omega_i, \omega_o)F(\omega_i, \omega_h)}{4\cos\theta_i\cos\theta_o}$$

11

## Torrance-Sparrow Model (cont.)

- Described by
  - Microfacet distribution  $D$
  - **Geometric attenuation  $G$**
  - Fresnel reflection  $F$

$$f_r(\omega_o \leftarrow \omega_i) = \frac{D(\omega_h)\boxed{G(\omega_i, \omega_o)}F(\omega_i, \omega_h)}{4\cos\theta_i\cos\theta_o}$$

12

## Torrance-Sparrow Model (cont.)

- Configuration

13

13

## Torrance-Sparrow Model (cont.)

- Geometry attenuation factor

$$G = \frac{\text{facet area that is both visible and illuminated}}{\text{total facet area}}$$

14

14

## Torrance-Sparrow Model (cont.)

- Shadowing term

$$1 - \frac{m_s}{w} \quad \begin{aligned} a \sin \theta_i &= w \cos \theta_h + m_s \cos \theta_h \times \cos \theta_i \\ a \cos \theta_i &= w \sin \theta_h - m_s \sin \theta_h \times -\sin \theta_i \end{aligned}$$

$$\frac{m_s}{w} = -\frac{\cos(\theta_h + \theta_i)}{\cos(\theta_h - \theta_i)}$$

$$1 - \frac{m_s}{w} = \frac{2 \cos \theta_h \cos \theta_i}{\cos(\theta_h - \theta_i)}$$

15

15

## Torrance-Sparrow Model (cont.)

- Masking term

$$1 - \frac{m_v}{w} \quad \begin{aligned} a \sin \theta_o &= w \cos \theta_h + m_s \cos \theta_h \times \cos \theta_o \\ a \cos \theta_o &= w \sin \theta_h + m_s \sin \theta_h \times -\sin \theta_o \end{aligned}$$

$$1 - \frac{m_v}{w} = \frac{2 \cos \theta_h \cos \theta_o}{\cos(\theta_h - \theta_o)}$$

16

16

## Torrance-Sparrow Model (cont.)

- Geometry attenuation factor

$$G = \frac{\text{facet area that is both visible and illuminated}}{\text{total facet area}}$$

$$G = \min \left( 1 - \frac{m_s}{w}, 1 - \frac{m_v}{w} \right) = \min \left( \frac{2\cos\theta_h\cos\theta_i}{\cos(\theta_h - \theta_i)}, \frac{2\cos\theta_h\cos\theta_o}{\cos(\theta_h - \theta_o)} \right)$$

17

17

## Torrance-Sparrow Model (cont.)

- Described by
  - Microfacet distribution  $D$
  - Geometric attenuation  $G$
  - **Fresnel reflection  $F$**

$$f_r(\omega_o \leftarrow \omega_i) = \frac{D(\omega_h)G(\omega_i, \omega_o)F(\omega_i, \omega_h)}{4\cos\theta_i\cos\theta_o}$$

18

18

## Torrance-Sparrow Model (cont.)

- Real-world surface has both **reflection** and **transmission**
  - Perfect specular reflection:  $\theta_i = \theta_o$
  - Perfect specular transmission:  $\eta_i \sin\theta_i = \eta_t \sin\theta_t$  (Snell's law)  
index of refraction

19

19

## Torrance-Sparrow Model (cont.)

- **Reflectivity** and **transmissiveness**: fraction of incoming light that is reflected or transmitted
    - Usually **view dependent**
    - Hence, the reflectivity is not a constant and should be corrected by the **Fresnel equation**
  - Fresnel equation
    - Related to the wave's electric field
    - S polarization and P polarization
- [https://en.wikipedia.org/wiki/Fresnel\\_equations](https://en.wikipedia.org/wiki/Fresnel_equations)

20

20

## Torrance-Sparrow Model (cont.)

- Different properties for dielectrics and conductors

$$r_{\parallel} = \frac{\eta_t \cos \theta_i - \eta_i \cos \theta_t}{\eta_t \cos \theta_i + \eta_i \cos \theta_t} \quad r_{\parallel}^2 = \frac{(\eta^2 + k^2) \cos^2 \theta_i - 2\eta \cos \theta_i + 1}{(\eta^2 + k^2) \cos^2 \theta_i + 2\eta \cos \theta_i + 1}$$

$$r_{\perp} = \frac{\eta_i \cos \theta_i - \eta_t \cos \theta_t}{\eta_i \cos \theta_i + \eta_t \cos \theta_t} \quad r_{\perp}^2 = \frac{(\eta^2 + k^2) - 2\eta \cos \theta_i + \cos^2 \theta_i}{(\eta^2 + k^2) + 2\eta \cos \theta_i + \cos^2 \theta_i}$$

Fresnel reflectance for **dielectrics**      Fresnel reflectance for **conductors**

$$F_r(\omega_i) = \frac{1}{2} (r_{\parallel}^2 + r_{\perp}^2)$$

assume light is unpolarized

21

21

## Torrance-Sparrow Model (cont.)

- Indices of refraction

medium	Index of refraction
Vacuum	1.0
Air at sea level	1.00029
Ice	1.31
Water (20°C)	1.333
Fused quartz	1.46
Glass	1.5-1.6
Sapphire	1.77
Diamond	2.42

22

22

## Torrance-Sparrow Model (cont.)

perfect specular refraction

23

23

## Torrance-Sparrow Model (cont.)

perfect specular transmission (refraction)

24

24

## Torrance-Sparrow Model (cont.)

Fresnel modulation

25

25

## Torrance-Sparrow Model (cont.)

- Described by
  - Microfacet distribution  $D$
  - Geometric attenuation  $G$
  - Fresnel reflection  $F$

$$f_r(\omega_o \leftarrow \omega_i) = \frac{D(\omega_h)G(\omega_i, \omega_o)F(\omega_i, \omega_h)}{4\cos\theta_i\cos\theta_o}$$

How many micro surfaces have this orientation

Commonly used distributions: Beckmann, GGX

$$D(\omega_h) = \frac{\alpha^2}{\pi((\mathbf{n} \cdot \omega_h)^2 (\alpha^2 - 1) + 1)^2}$$

26

26

## Torrance-Sparrow Model (cont.)

- Put it all together

measured

Blinn-Phong

Cook-Torrance  
(microfacet)

27

27

## Oren-Nayar Model

- Many real-world materials such as concrete, sand and cloth are not real Lambertian
  - Specifically, rough surfaces generally appear brighter as the illumination direction approaches the viewing direction

Lambertian model

real image

- Assumption: a surface is composed of a collection of **perfectly Lambertian** grooves whose orientation angles follow a Gaussian distribution

28

28

## Oren-Nayar Model (cont.)

$$f_r(\omega_o \leftarrow \omega_i) = \frac{\rho}{\pi} (A + B \max(0, \cos(\phi_i - \phi_o)) \sin \alpha \tan \beta)$$

$$A = 1 - \frac{\sigma^2}{2(\sigma^2 + 0.33)}$$

$\sigma^2$  the standard deviation of Gaussian

$$B = \frac{0.45\sigma^2}{\sigma^2 + 0.09}$$

$$\alpha = \max(\theta_i, \theta_o)$$

$$\beta = \min(\theta_i, \theta_o)$$

29

29

## Oren-Nayar Model (cont.)

Lambertian model

30

30

## Oren-Nayar Model (cont.)

Oren-Nayar model

31

31

## Oren-Nayar Model (cont.)

- When the standard deviation  $\sigma$  becomes zero, Oren-Nayar model is reduced to Lambertian model

$$f_r(\omega_o \leftarrow \omega_i) = \frac{\rho}{\pi} (A + B \max(0, \cos(\phi_i - \phi_o)) \sin \alpha \tan \beta)$$

$$\Rightarrow f_r(\omega_o \leftarrow \omega_i) = \frac{\rho}{\pi}$$

 $\sigma = 0$  $\sigma = 0.1$  $\sigma = 0.3$ 

32

32

## Materials Beyond BRDF

33

33

## Subsurface Scattering

- Some materials interact with lights with a subsurface scattering process that **allows lights to enter and scatter within a medium**
- It gives objects a distinct soft look

34

34

## BSSRDF

- BRDF v.s. BSSRDF

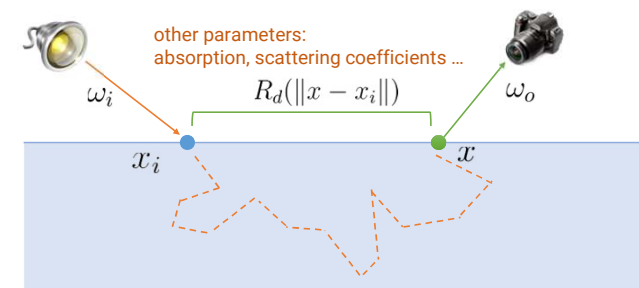

Bidirectional Reflectance  
Distribution Function  
(BRDF)

Bidirectional Subsurface  
Scattering Reflectance  
Distribution Function  
(BSSRDF)

35

35

## Approximate BSSRDF with Dipole

$$S(x, \omega_o; x_i, \omega_i) = S^1(x, \omega_o; x_i, \omega_i) + S^d(x, \omega_o; x_i, \omega_i)$$

$$S^d(x, \omega_o; x_i, \omega_i) = \frac{1}{\pi} F_t(\eta, \omega_o) R_d(\|x - x_i\|) F_t(\eta, \omega_i)$$

"A Practical Model for Subsurface Light Transport", Jensen et al. 2001

36

36

## BRDF for Production

37

37

## Disney Principled BRDF

- **Phenomenological models**
  - More intuitive parameters; however, not accurate
- **Geometric optics**
  - More accurate but difficult to use by artists
- **Disney Principled BRDF** would like to combine the advantages of both models!
  - Represent a physically-based model (based on the Microfacet model) with few intuitive parameters
  - Each parameter has a range between [0, 1]
  - <https://disneyanimation.com/publications/physically-based-shading-at-disney/>

38

38

## Disney Principled BRDF (cont.)

- Proposed when producing the movie, **Wreck-It Ralph** (2012)
  - Also used by the **Unity** and **Unreal** engine

39

39

## Disney Principled BRDF (cont.)

40

40

## Disney Principled BRDF (cont.)

- Code: <https://github.com/wdas/brdf/blob/main/src/brdfs/disney.brdp>

$$f_{\text{disney}}(\omega_i, \omega_o) = (1 - \sigma_m) \left( \frac{C}{\pi} \text{mix}(\overset{\text{diffuse}}{f_d(\omega_i, \omega_o)}, \overset{\text{subsurface}}{f_{ss}(\omega_i, \omega_o)}, \sigma_{ss}) + \overset{\text{sheen}}{f_{sh}(\omega_i, \omega_o)} \right) \\ + \frac{F_s(\theta_d) G_s(\omega_i, \omega_o) D_s(\omega_h)}{4 \cos \theta_i \cos \theta_o} \quad \text{specular} \\ + \frac{\sigma_c}{4} \frac{F_c(\theta_d) G_c(\omega_i, \omega_o) D_c(\omega_i, \omega_o)}{4 \cos \theta_i \cos \theta_o} \quad \text{clearcoat}$$

$$f_d(\omega_i, \omega_o) = (1 + (F_{D90} - 1)(1 - \cos \theta_i)^5)(1 + (F_{D90} - 1)(1 - \cos \theta_o)^5) \\ F_{D90} = 0.5 + 2 \cos^2 \theta_d \sigma_r$$

$$f_{ss}(\omega_i, \omega_o) = 1.25(F_{ss}(1/(\cos \theta_i + \cos \theta_o) - 0.5) + 0.5) \\ F_{ss} = (1 + (F_{ss90} - 1)(1 - \cos \theta_i)^5)(1 + (F_{ss90} - 1)(1 - \cos \theta_o)^5) \\ F_{ss90} = \cos^2 \theta_d \sigma_r$$

$$f_{sh}(\omega_i, \omega_o) = \text{mix}(\text{one}, C_{\text{tint}}, \sigma_{\text{sh}}) \sigma_{\text{sh}} (1 - \cos \theta_d)^5 \\ C_{\text{tint}} = \frac{C}{\text{lin}(C)}$$

$$F_s(\theta_d) = C_s + (1 - C_s)(1 - \cos \theta_d)^5 \\ C_s = \text{mix}(0.08 \sigma_r \text{mix}(\text{one}, C_{\text{int}}, \sigma_{st}), C, \sigma_m)$$

$$G_s(\omega_i, \omega_o) = G_{s1}(\omega_i) G_{s1}(\omega_o)$$

$$D_s(\omega_h) = \frac{1}{\pi \alpha_s \alpha_b \left( \sin^2 \theta_h \left( \frac{\cos^2 \phi}{\alpha_s^2} + \frac{\sin^2 \phi}{\alpha_b^2} \right) + \cos^2 \theta_h \right)^2}$$

$$F_c(\theta_d) = 0.04 + 0.96(1 - \cos \theta_d)^5$$

$$G_c(\omega_i, \omega_o) = G_{c1}(\omega_i) G_{c1}(\omega_o)$$

$$D_c(\omega_h) = \frac{C}{2\pi \ln(\alpha^2 \cos^2 \theta_h + \sin^2 \theta_h)}$$
