

# Geometry Representation

Introduction to Computer Graphics  
Yu-Ting Wu

1

1

## Define the 3D World

2

2

## Description of the 3D World

- 3D coordinate systems

3

3

## Points in 3D

4

4

## Vector in 3D Space

- Use to represent direction (e.g., movement) in the 3D world

5

## Triangles in 3D

6

## Triangle Mesh

- We can define the geometry of an object by specifying the coordinates of the vertices and their adjacencies

7

## Triangle Mesh (cont.)

- Using more triangles can lead to higher-quality meshes
  - However, takes more time to render

8

## Scene Built with Triangle Mesh

9

## Surface Normal

- A **surface normal** is a vector that is **perpendicular** to a surface at a particular position
- Represent the orientation of the face
- The length of a normal should be equal to **1**

10

10

## Point, Triangle, and Surface Normal

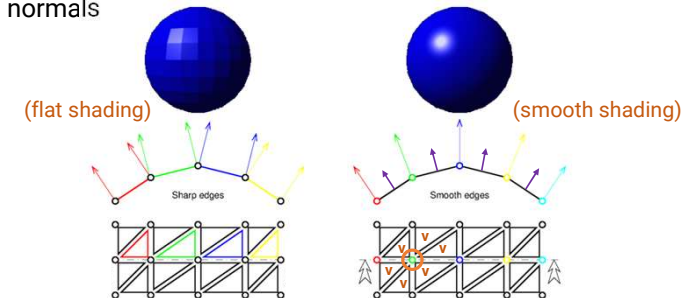

11

11

## Vertex Normal

- Compute by **averaging** the surface normals of the faces that contain that vertex
- Can achieve much **smooth** shading than using triangle normals

12

12

## 3D Model Format

- A model is often stored in a file
- Common file format includes
  - Wavefront (\*.obj)
  - Polygon file format (\*.ply)
  - Filmbox (\*.fbx)
  - MAX (\*.max)
  - Digital Asset Exchange File (\*.dae)
  - STereoLithography (\*.stl)

13

## Example: Wavefront OBJ File Format

- cube.obj

14

## Example: Wavefront OBJ File Format (cont.)

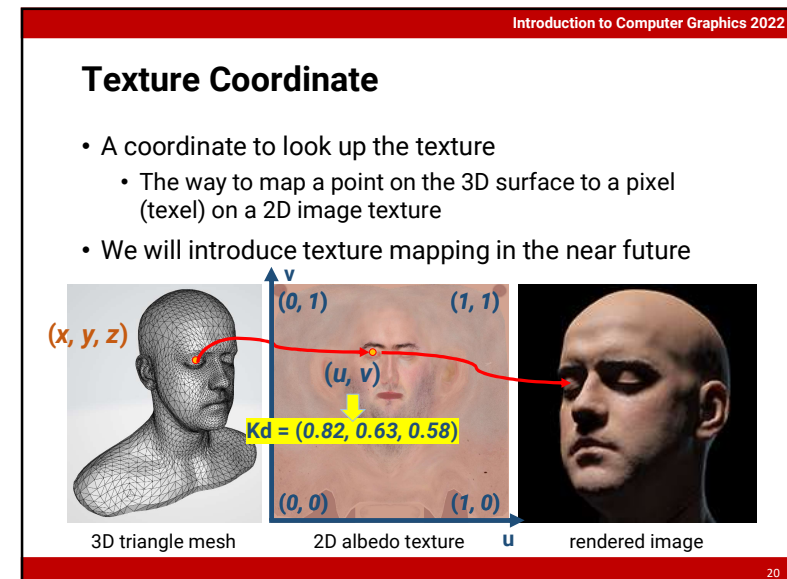

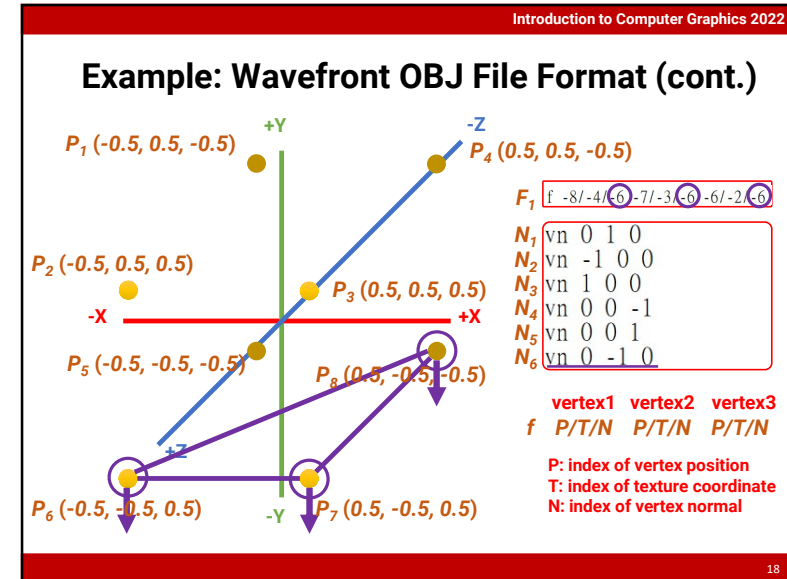

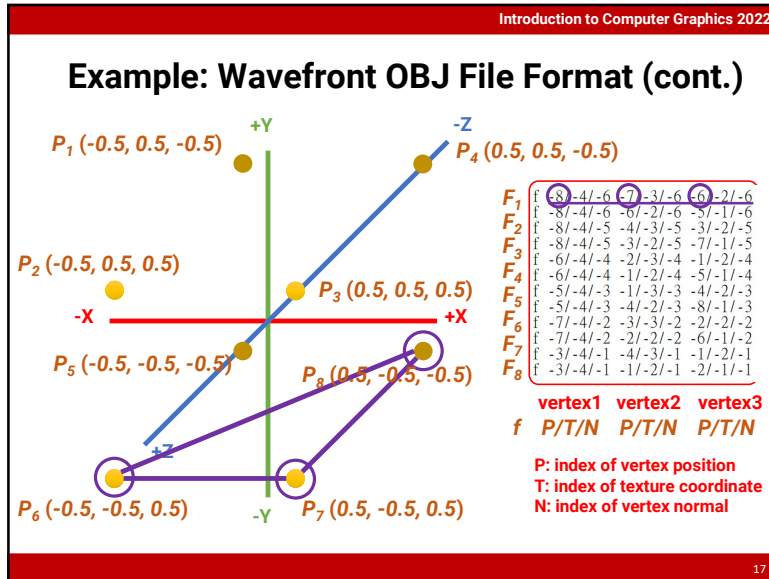

15

## Example: Wavefront OBJ File Format (cont.)

16

## Transformation

21

21

## World Space and World Coordinate

- Objects are defined in **object space individually**
- When building a scene, each object is transformed to a **global** and **unique** space called **world space**
- The transform is called **world transform**

22

22

## World Space and World Coordinate (cont.)

- Advantages for using "transformation"
  - **Reuse model**: design a model and use it in several scenes
  - **Memory saving**: store a 4x4 matrix instead of duplication of the entire models

23

23

## Common Transformations

- Translation
- Scaling
- Rotation

24

24

## 2D Translation

- Given a point  $p(x, y)$  and a translation offset  $T(t_x, t_y)$ , the new point  $p'(x', y')$  after translation is  $p' = p + T$

$$x' = x + t_x$$

$$y' = y + t_y$$

- Can be represented as Matrix-vector multiplication

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

25

25

## 2D Scaling

- Given a point  $p(x, y)$  and a scaling factor  $S(s_x, s_y)$ , the new point  $p'(x', y')$  after scaling is  $p' = S p$

$$x' = x * s_x$$

$$y' = y * s_y$$

- Matrix-vector multiplication

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

26

26

## 2D Rotation

- Given a point  $p(x, y)$ , rotate it with respect to the **origin** by  $\theta$  and get the new point  $p'(x', y')$  after rotation

- First we define

$\theta > 0$ : rotate  
counterclockwise

$\theta < 0$ : rotate  
clockwise

27

27

## 2D Rotation (cont.)

- Given a point  $p(x, y)$ , rotate it with respect to the **origin** by  $\theta$  and get the new point  $p'(x', y')$  after rotation

$$x = r \cos(\phi) \quad y = r \sin(\phi)$$

$$x' = r \cos(\phi + \theta) \quad y' = r \sin(\phi + \theta)$$

$$x' = r \cos(\phi + \theta)$$

$$= r \cos(\phi) \cos(\theta) - r \sin(\phi) \sin(\theta)$$

$$= x \cos(\theta) - y \sin(\theta)$$

$$y' = r \sin(\phi + \theta)$$

$$= x \sin(\phi) \cos(\theta) + r \cos(\phi) \sin(\theta)$$

$$= y \cos(\theta) + x \sin(\theta)$$

28

28

## 2D Rotation (cont.)

- Given a point  $p(x, y)$ , rotate it with respect to the **origin** by  $\theta$  and get the new point  $p'(x', y')$  after rotation

$$\begin{aligned}x' &= r\cos(\phi + \theta) \\ &= x\cos(\theta) - y\sin(\theta) \\ y' &= r\sin(\phi + \theta) \\ &= y\cos(\theta) + x\sin(\theta)\end{aligned}$$

- Matrix-vector multiplication

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

29

29

## 2D Translation, Scaling, and Rotation

- Translation  $\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$
- Scaling  $\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$
- Rotation  $\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$
- Using a 3x3 matrix allows us to perform all transformations using matrix/vector multiplications
  - We can also **pre-multiply (concatenate)** all the matrices

30

30

## Homogeneous Coordinate

- We call the  $(x, y, 1)$  representation the **homogeneous coordinate** for  $(x, y)$

$$\begin{bmatrix} x' \\ y' \\ w \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- If  $w$  is not equal to 1, to make the transformed coordinate also homogeneous, we need to divide the  $x$  and  $y$  components by  $w$

$$x' = x'/w \quad y' = y'/w \quad w = 1$$

31

31

## Revisit 2D Scaling

- The standard scaling matrix will only anchor at  $(0, 0)$

- What if we want the object to be scaled w.r.t its center?

32

32

## Revisit 2D Scaling (cont.)

- Scaling about an arbitrary pivot point  $Q(q_x, q_y)$ 
  - Translate the objects so that Q will coincide with the origin:  $T(-q_x, -q_y)$
  - Scale the object:  $S(s_x, s_y)$
  - Translate the object back:  $T(q_x, q_y)$
- The final scaling matrix can be written as  $T(q)S(s)T(-q)$  Concatenation of matrices

33

33

## Revisit 2D Rotation

- The standard rotation matrix is used to rotate about the origin (0, 0)

- What if we want the object to be rotated w.r.t a specific pivot?

34

34

## Revisit 2D Rotation (cont.)

- Rotate about an arbitrary pivot point  $Q(q_x, q_y)$  by  $\theta$ 
  - Translate the objects so that Q will coincide with the origin:  $T(-q_x, -q_y)$
  - Rotate the object:  $R(\theta)$
  - Translate the object back:  $T(q_x, q_y)$
- The final rotation matrix can be written as  $T(q)R(\theta)T(-q)$

35

35

## Translation (3D) and Scaling (3D)

- A 3D transformation is represented as a **4x4 matrix**, with **homogeneous coordinate**

$$\begin{array}{ll}
 \text{translation} & \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 0 & 0 & t_x \\ 0 & 1 & 0 & t_y \\ 0 & 0 & 1 & t_z \\ 0 & 0 & 0 & 1 \end{bmatrix} \\
 \text{scaling} & \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} s_x & 0 & 0 & 0 \\ 0 & s_y & 0 & 0 \\ 0 & 0 & s_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}
 \end{array}$$

2D 3D

36

36

## Rotation (3D)

	rotation w.r.t x-axis	$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta & 0 \\ 0 & \sin\theta & \cos\theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$
$\begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix}$	rotation w.r.t y-axis	$\begin{bmatrix} \cos\theta & 0 & \sin\theta & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\theta & 0 & \cos\theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$
	rotation w.r.t z-axis	$\begin{bmatrix} \cos\theta & -\sin\theta & 0 & 0 \\ \sin\theta & \cos\theta & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$

2D 3D

37

37

## 3D Transformation

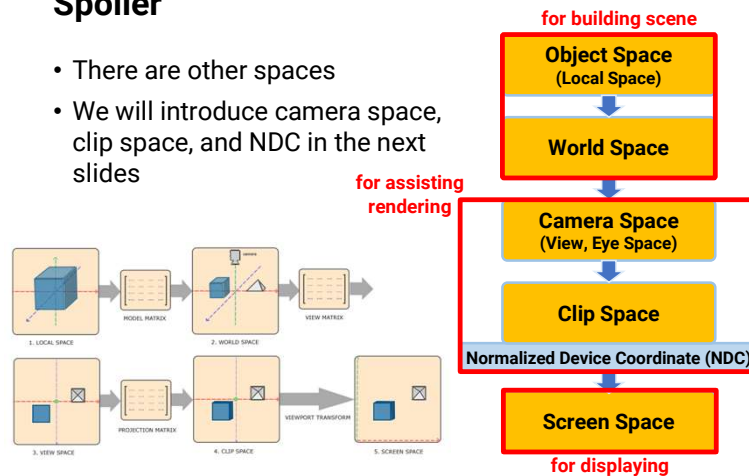

- Practice
  - Scale w.r.t a given pivot point
  - Rotate w.r.t a given pivot point

38

38

## Spoiler

- There are other spaces
- We will introduce camera space, clip space, and NDC in the next slides

39
